

Healthcare Workforce Mental Health Analysis Using Excel Pivot Tables and Charts

Prepared By: Mfoniso Isaac Udo

Date: May 2026

1) Which department records the highest average stress level?

INSIGHT;

The analysis reveals that stress levels vary significantly across healthcare departments. Departments with demanding patient care responsibilities tend to experience higher stress compared to others. This may indicate the need for better workload management and mental health support in high-pressure units.

2) How does burnout frequency affect job satisfaction?

INSIGHT;
Employees who experience burnout more frequently generally report lower job satisfaction levels. The trend clearly shows a decline in morale as burnout increases. This suggests that reducing burnout could positively improve employee engagement and workplace satisfaction.

3) Which workplace factor contributes most to employee stress?

INSIGHT;

Some workplace conditions contribute more heavily to stress than others. Factors related to workload pressure and work-life imbalance appear to have the strongest impact on employee wellbeing. Addressing these challenges may help create a healthier and more productive work environment.

4) Does access to Employee Assistance Programs (EAPs) improve job satisfaction?

INSIGHT;

Employees with access to support programs tend to report better job satisfaction levels than those without access. This suggests that mental health resources and counseling services play an important role in improving employee wellbeing. Expanding EAP availability may contribute to better staff retention and morale.

5) Which employee type records the highest mental health-related absences?

INSIGHT;

Mental health-related absences differ across healthcare professions. Staff working in emotionally demanding and high-pressure roles appear to record more absences compared to others. This may reflect the psychological impact of prolonged workplace stress in frontline healthcare settings.

6) Does stress level influence turnover intention among employees?

INSIGHT;
Employees who express intentions to leave the organization generally report higher stress levels. The findings suggest that workplace stress may be a major contributor to employee turnover in healthcare organizations. Reducing stress could therefore improve staff retention and organizational stability.

7) What is the average job satisfaction across departments

INSIGHT;
Job satisfaction levels differ noticeably across departments within the healthcare workforce. Departments facing heavier workloads and operational pressure tend to show lower satisfaction scores. Improving workplace conditions in these departments may help enhance employee morale and productivity.
