Microsoft Excel

SQL Server

Power BI

Healthcare Workforce Mental Health Dashboard

Project Overview & Objectives

The healthcare industry is highly demanding and can significantly affect employee mental health and workplace performance. This project analyzes healthcare workforce data to identify patterns related to stress, burnout, job satisfaction, mental health absences, employee assistance program access, and turnover intention.

Project Objectives

- Analyze employee stress levels across departments.
- Identify major workplace factors contributing to stress.
- Examine burnout frequency among healthcare workers.
- Assess employee job satisfaction levels.
- Evaluate mental health absence trends.
- Analyze workforce retention and turnover intention.
- Provide recommendations to improve employee wellbeing.

Healthcare Workforce Mental Health Dashboard

DATASET OVERVIEW

The dataset contains information on **5,000 healthcare employees** from multiple healthcare professions and departments.

Key Variables

- Employee Type & Employee ID
- Department
- Workplace Factor
- Stress Level
- Burnout Frequency
- Job Satisfaction
- Access to Employee Assistance Programs (EAPs)
- Mental Health Absences
- Turnover Intention

Dataset Size

- Total Employees: 5,000
- Multiple Healthcare Professions
- Multiple Clinical Departments

Healthcare Workforce Mental Health Dashboard

Methodology

Excel :

Cleaned and prepared the healthcare workforce dataset. Conducted preliminary analysis using Pivot Tables and charts.

SQL :

Explored workforce trends and calculated key metrics. Analyzed stress, burnout, absenteeism, and retention indicators.

Power BI :

Created DAX measures and KPIs.
Built interactive dashboards to visualize workforce mental health insights.
This is much cleaner and more suitable for a single presentation slide.

Healthcare Workforce Mental Health Dashboard

SQL Analysis & Key Findings

Structured Query Language (SQL) was used to explore and analyze the dataset before visualization.

Key Analysis Performed

- Total number of healthcare employees
- Employee distribution by profession
- Average stress levels by department
- Burnout frequency analysis
- Job satisfaction assessment
- Mental health absence analysis
- Employee Assistance Program access analysis
- Turnover intention analysis

Outcome

The SQL analysis provided valuable insights that guided the Power BI dashboard development process.

Healthcare Workforce Mental Health Dashboard

Power BI Data Model

A single-table healthcare workforce dataset was imported into Power BI for analysis. A dedicated DAX Measures table was created to store calculated measures and KPIs.

Measures Created

Total Employees

Average Stress Level

Average Job Satisfaction

Total Mental Health Absences

Average Mental Health Absences

Frequent Burnout Cases

Employees with Turnover Intention

EAP Access Rate

Average Absence per Employee

Model Structure

The project uses a flat-file structure; therefore, no table relationships were required.

Healthcare Workforce Mental Health Dashboard

Workforce Overview Dashboard

Key Insights

- The average employee stress level is relatively high at 7.3.
- Job satisfaction levels remain low across the workforce.
- ICU and General Practice departments recorded the highest stress levels.
- Mental health concerns continue to impact healthcare employees significantly.
- Workforce distribution shows Registered Nurses represent the largest employee group.

The average employee stress level is relatively high at 7.3.

Job satisfaction levels remain low across the workforce.

ICU and General Practice departments recorded the highest stress levels.

Mental health concerns continue to impact healthcare employees significantly.

Workforce distribution shows Registered Nurses represent the largest employee group.

Healthcare Workforce Mental Health Dashboard

Stress & Burnout Analysis Dashboard

Key Insights

- Heavy workload emerged as the most significant workplace stress factor.
- Burnout occurs frequently among healthcare employees.
- High stress levels are consistently observed across several professions.
- Workplace factors such as workload, work-life imbalance, and safety concerns contribute significantly to employee stress.
- Stress management interventions may help reduce burnout levels.

Healthcare Workforce Mental Health Dashboard

Absenteeism & Retention Dashboard

Key Insights

- Total mental health absences exceed 37,000 recorded absence days.
- Approximately 66.7% of employees indicated turnover intention.
- Employees experience an average of 7.4 mental health absence days.
- Most employees have access to Employee Assistance Programs (EAPs).
- Certain departments experience higher absence levels than others.

Absenteeism & Workforce Retention Dashboard

Healthcare Workforce Mental Health Dashboard

Recommendations

Improve Employee Mental Health Support

- Expand Employee Assistance Programs (EAPs).
- Increase access to mental health counseling services.

Reduce Workplace Stress

- Address heavy workload concerns.
- Improve staffing levels in high-pressure departments.

Strengthen Burnout Prevention Programs

- Introduce wellness initiatives.
- Promote work-life balance policies.

Improve Employee Retention

- Increase employee engagement programs.
- Enhance career development opportunities.
- Conduct regular employee satisfaction assessments.

Healthcare Workforce Mental Health Dashboard

Conclusion

This project successfully analyzed healthcare workforce mental health indicators using SQL and Power BI.

The findings reveal elevated stress levels, frequent burnout cases, significant mental health absences, and notable turnover intention among healthcare employees.

Organizations can improve employee wellbeing and workforce stability by implementing targeted mental health support programs, reducing workplace stressors, and strengthening employee retention strategies.
